Definition 1: Given an LPN $G = (PN, M_0, E, \lambda)$, let $\langle \tilde{P}N, \tilde{M}_0 \rangle$ with $\tilde{P}N = (\tilde{P}, \tilde{T}, \tilde{Pre}, \tilde{Post})$ be its FP²N. The BFP²G of G is a deterministic finite-state automaton $\mathcal{B} = (\tilde{\mathcal{M}}_B, \tilde{T}_{or}, \Delta, \tilde{M}_0)$ computed by using Algorithm 1, where $\tilde{\mathcal{M}}_B \subseteq \tilde{\mathcal{M}}_B^2 \cup \tilde{\mathcal{M}}_{B_{ij}}^1$ for all i and j with $(\tilde{M}_i, \tilde{B}_j) \in \tilde{M}_{x_d}^2$ is the set of states, $\tilde{T}_{or} = \tilde{T}_o \times \mathbb{N}^{|\tilde{T}_u|}$ is the set of events, $\Delta \subseteq \tilde{\mathcal{M}}_B \times \tilde{T}_{or} \times \tilde{\mathcal{M}}_B$ is the transition relation, and \tilde{M}_0 is the initial state.

- 31: $\Delta := \Delta \cup \{(\tilde{M}, (t, \pi(\sigma)), \tilde{M}')\}$;
- 32: **end for**

In Algorithm 1, the set $\tilde{\mathcal{M}}_{new}$ is initialized at $\{(\tilde{M}_0, \emptyset)\}$ in Step 2. For each pair $(\tilde{M}, B) \in \tilde{\mathcal{M}}_{new}$, if it is dangerous, we call function *BasisSonNodes* in Step 7 to compute

a basis son graph for the nonfailure subnet of the FPLN, which describes the normal behaviour of the FP²N from \tilde{M} by firing the transitions in \tilde{T}_o^1 and the corresponding minimal explanations. Otherwise, Steps 11 to 25 compute each successor pair (\tilde{M}', \tilde{B}') by firing each transition in \tilde{T}_o^2 and its minimal explanation restricted to $\tilde{T}_u^2 \setminus \tilde{T}^{FP}$, and compute the new arc from (\tilde{M}, B) to (\tilde{M}', \tilde{B}') . Then, Step 27 removes (\tilde{M}, B) from $\tilde{\mathcal{M}}_{new}$ indicating that (\tilde{M}, B) has been considered. The procedure from Steps 3 to Step 28 is executed iteratively until $\tilde{\mathcal{M}}_{new}$ is empty. Finally, by running Steps 29 to 32, the BFP²G is obtained by removing the second component from each pair $(\tilde{M}, B) \in \tilde{\mathcal{M}}_x$.
